

# OmniWMS

Warehouse Management System

Omni WMS is a warehouse management system that consists of desktop application and portable (PDT) devices designed to optimize and accelerate the reception, issuing, and movement of goods through the warehouse.

With the help of a desktop application, the operator manages receiving and shipping orders, assigns devices with tasks, monitors the inventory and task status. Operators with PDTs handle orders through a warehouse by reading barcode items.

Omni WMS can be linked to any business program of newer generations such as Datalab Pantheon, Microsoft NAV, SAP, and similar.

- **High degree of accuracy of goods address locations**
- **Increase order processing capacity**
- **Improving the precision of delivery of ordered goods**
- **Optimization of warehousing goods in the warehouse**
- **Significant acceleration of receipt and release of goods**
- **Complete check of stocks**
- **100% free of paper**
